Located in Eden Prairie, Mitchell Lake is a part of the Purgatory Creek chain of lakes. During high water events it outflows through an overflow pipe to Red Rock Lake.

**WATERSHED MANAGEMENT PLAN**

One of the most important projects the watershed worked on in 2017 was updating its Watershed Management Plan. This watershed management plan (also called the 10-Year Plan) guides the District’s actions for the next 10 years.

The community played an essential role by participating in a public engagement process. Close to 500 stakeholders engaged in this process, making their voices heard about their values for clean water. The graphic to the right highlights how the community contributed to the planning effort.

**WATERSHED BOUNDARIES**

Water that falls anywhere within the white border drains to Mitchell Lake.

**LAND USE in the Mitchell Lake Watershed**

- **12%** Commercial
- **56%** Residential
- **14%** Open Space
- **5%** Roads
- **13%** Open Water

**Thank you!** To everyone who shared their thoughts, ideas, hopes and concerns. We truly appreciate you being a part of this process.
How healthy is Mitchell Lake?

After decades of failing to meet the clean water standards set by the Minnesota Pollution Control Agency (MPCA), Mitchell Lake has improved and been at or near standards for the last seven years. Continued water sampling will help monitor whether the trend persists.

The graphs on the next page show the trends over time. The red line on each graph marks the MPCA standard. The goal is for the average values (the dots) to be below the red line.

During the growing season (Jun - Sept), the city of Eden Prairie visits Mitchell Lake to collect water samples and take measurements. The samples are tested for several compounds including total phosphorous (TP) and chlorophyll a (Chl-a). The city also measures how clear the water is using a disk that is lowered into the water until it cannot be seen. These tests help indicate if the water is clean.

Mitchell is classified as a "Shallow Lake", which means that it is generally less than 15 feet deep and light can reach the bottom in most of the lake. This ample light means that shallow lakes often have a lot of aquatic plants, and are habitat to many types of fish and birds. To be considered healthy by the MPCA, shallow lakes need to be clear enough to see one meter down, and have low TP and Chl-a levels.

Rainwater runoff, the water that flows across yards, parking lots, and streets into stormdrains, is one of the main causes of pollution in urban areas. You can take simple actions to help protect Mitchell Lake.

**Keep the curb clean**
- Sweep up leaves, grass clippings, and fertilizer from driveways and streets.

**Water with care**
- Grass requires 1-inch of water per week; about one hour of sprinkling per week if it has not rained.

**Salt smart**
- The salt we use to melt ice can pollute our lakes and creeks. Use salt sparingly and always shovel first.

**Reuse the rain**
- Collect and reuse rainwater with a rain barrel.

**Build a raingarden**
- Raingardens soak up water and filter out pollution. Visit our website for help.

**Help keep Mitchell healthy**

Phosphorus is a nutrient that plants and algae need for growth. It is often measured as total phosphorus (TP). Too much phosphorous can cause algae blooms.

Chlorophyll a is the main pigment in algae, so measuring chl-a can tell us how much algae there is. Too much chl-a means that there are too many nutrients in the water.

**Water clarity**
- Water clarity is measured using a Secchi Disk, a black and white disk the size of a dinner plate. It is lowered into the water, and the depth at which it is no longer visible is recorded.
